Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Purification and characterization of a novel inhibitor of the proliferation of hepatic stellate cells.";

J. Biochem. 127:23-27(2000).
-!- FUNCTION: MAY ACT AS A NEGATIVE EFFECTOR IN THE REGULATION OF THE HEPATIC STELLATE CELLS (HSC). ALSO INHIBITS THE GROWTH OF BOVINE ENDOTHELIAL CELLS AND 316 FIBROBLASTS.
-!- SMILLARITY: IDENTICAL TO THE 63-70 AA REGION OF THE RAT ZAG
                                                                                                                                                                                                                                                                                                                                                                                                           01-0CT-2000 (TrEMBLrel. 15, Created)

Sequence 9, Application US/07714540
Patent NO. 5562521
GENERAL INFORMATION:
APPLICANT: Almquist, Ronald G.
APPLICANT: Toll, Lawrence
TITLE OF INVENTION: ISOLATED ATRIAL PEPTIDE-DEGRADING
TITLE OF INVENTION: ENZYME AND NOVEL COMPOUNDS USEFUL AS INHIBITORS THEREOF NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESSS:
ADDRESSEE: ITELL & Manella
STREET: 545 Middlefield Road, Suite 200
CITY: Menlo Park
STATE: California

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 5, Application US/08000931
Patent No. 5578477
GENERAL INFORMATION:
PAPLICANT: Tamanoi Dr., Fuyuhiko
TITLE OF INVENTION: IDENTIFICATION AND CHARACTERIZATION OF
TITLE OF INVENTION: INHIBITORS OF PROTEIN FARNESYLTRANSFERASE
NUMBER OF SEQUENCES: 10
CORRESPONDENCE ADDRESS:
ADDRESSEE: Foley & Lardner
STREET: 3000 K Street, N.W., Suite 500
COUNTRY: Washington, D.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

US-00-474-175A

Patent No. 586940

EARLAL INCRATION

TITLE OF INVENTION: METHODS AND APPARATUS FOR SEQUENCING

TITLE OF INVENTION: SPECTROMETRY.

NUMBER OF SEQUENCES: 23

CORRESPONDENCE ADDRESS: 23

CORRESPONDENCE ADDRESS: 34

COURREY DESCRIPTION: DIA SPECTROMETRY.

ADDRESSEE: Patent Administrator - Testa, Hurwitz & COUNTRY: USA

ITTLE OF INVENTION: SPECTROMETRY: USA

ITTLE OF INVENTION: DIA STREET: High Street Tower, 125 High Street

COUNTRY: USA

ITTLE OF INVENTION: DIA STREET: HIGH STREET This Dead the Compatible

COUNTRY: USA

INFORMATION OF SECONDERS: SOFTWARE: Patentin Release #1.0, Version #1.30

COMPUTER: ISA PECONDERS: SOFTWARE: Patentin Release #1.0, Version #1.30

CLASSIFICATION NUMBER: US/08/447,175A

FILING DATE: 19-MAY-1995

CLASSIFICATION NUMBER: SYP-114

TELECHOMET ARDRESSITION: TOWERS: SYP-114

TELECHOMET (617) 248-7000

```
The gonadotropin releasing hormone and its analogues are prepd. by a new multistage rapid peptide synthesis method in soln., where the intermediates are not isolated. The process is rapid and gives very pure peptide quickly and using little equipment. The peptide can be used in veterinary medicine to synchronise ovulation in large animal herds, and in human medicine in the treatment of fertility disorders. (Updated on 09-JAN-2003 to odd missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

Analogues (I) of the sequence pref. have amino acid (AA) substitutions at posns. 2 (his is replaced by a D-AA) and 6 (gly is replaced by a D-AA).

A therapeutically effective amt. of such an antagonist is contained in a pharmaceutical compsn. alongside a menopausal-symtom-alleviating and. of a 19-nor progestational agent (II) (pref. both in single formulation).

The compsn. is pref. administered nasally in dosages of 0.01-1 mg/kg/ day for (I) and 0.02-0.07 mg/kg/day for (II). May be used for inhibition of ovulation, and treatment of eg endometriosis, breast cancer, polycistic ovarian disease, or precocious puberry in female mammals.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Compsn. comprising LHRH-antagonist and 19-nor progestational agent for treating female gynaecological disorders based on gonads steroid producn.
This luteinising hormone releasing hormone (LHRH) agonist has either a ketomethylene or dihydroketomethylene gp. replacing the amide linkage between residues 9 and 10 in LHRH. This results in an increase in oral activity. It is useful for eg male and female contraception, treatment of precocious puberty and endometriosis and treatment of breast- and prostate tumours. The decapeptides is an antagonistic analogue of hypothalamic LHRH which possesses high antiovulatory and antineoplastic activity, is free of anaphylactoid side effects and is believed to be free of endematogenic effects. The peptide may be used to treat precocious prostate tumours, e.g. malignant and benign prostate tumours, e.g. secondary amenorrhoea, endometriosis and ovarian and mammary cystic diseases. The peptide is also useful for regulating ovulation e.g. as precoital or postcoital contraceptives, for synchronising oestrus in livestock and for improving the "rhythm" method. It is also useful for regulating the human menopausal and postmenopausal periods. As it suppresses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the spermatogenesis and testosterone levels in males, it may be of potential use for male contraception.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The C-terminal residue (GJy-CO-NH2) can be replaced by ethylamide. This peptide and fragments of it (i.e. amino acids 4-10, 5-10, 6-10 and 7-10) are agonists and antagonists of LHRH. They are useful for treating e.g. precocious or delayed puberty, psychiatric disorders esp. those of the libido or sexual aggression, etc. In addition they are useful for functional exploration of the hypothalamus-hypophyseal axis and for radioimmunological to biological assay (of LH, FSH and (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide homologous with luteinising hormone-releasing hormone - used to treat gynaecological conditions, cancer of gonads and sec. sexual organs, psychiatric conditions and in assays

Gonadotropin releasing hormone; GnRH; motility disorder; functional bowel disease; leuprolide acetate; luceinising hormone; progesterone; relaxin; autonomic nervous system; drug delivery; therapy; irritable bowel syndrome; diabetes; scleroderma; Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A new method is provided for preparing a decapeptide of formula pGlu-His-Trp-Ser-Tyr-Xaa-Leu-Arg-Pro-Gly-NH2, in which a protected nonapeptide corresponding to the N-terminal of the peptide is first prepared on a benzhydrylamine resin, the Pro residue being attached to the resin via a photosensitive linker. The nonapeptide is cleaved from the resin by photolysis, the C-terminal is activated, and the product is coupled with glycinamide to add the Gly-NH2. The decapeptide is then deprotected. In the decapeptide, Xaa is Gly (giving gonadorelin; the present sequence), D-2-Nal or D-Trp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Prepn. of luteinising hormone and follicle stimulating hormone releasing peptide(s) - by cleaving a protected nona-peptide resin by photolysis to remove the support, coupling with glycinamide and
                                      luteinising hormone releasing hormone; follicle stimulating; FSH; gonadorelin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Synthetic immunogenic peptides are provided in which a universal immune stimulator is linked to a peptide or protein hapten containing B cell and/or cytotoxic T lymphocyte epitopes, giving a product which causes potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiscuous helper T cell epitope (Th) which elicits an immune response to the coupled peptide in members of a heterogeneous population expressing diverse HLA phenotypes, and (B) an adjuvant peptide sequence from the invasin protein of Yersinia. Spacer amino acid sequence from the invasin protein of Yersinia. Invasin and Th domains and between the immune stimulator and hapten components. When the hapten is LHRH, then optionally the invasin domain can be omitted from the immune stimulator component.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents an LHRH hapten which can be attached to the stimulator to provide a potent vaccine for treating e.g. prostatic hyperplasia, androgen-dependent carcinoma, prostatic carcinoma, testicular carcinoma, endometriosis, benign uterine tumours, recurrent functional ovarian cysts, (severe) premenstrual syndrome or oestrogen-dependent breast cancer, or for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents naturally occuring gonadotropin releasing hormone (GRRH). Analogues of GRRH are represented by ARR66846-56.

Motility disorders, including functional bowel disease, can be treated by the administration of one of the GRRH analogues shown here (e.g. by the administration of one of the GRRH analogues shown here (e.g. production of reproductive hormones such as luteinisting hormone, progesterone and relaxin. Motility disorders are caused from abnormalities of the autonomic nervous system. The GRRH analogues are administered by injection (which may be intavenous, subcutaneous or intramuscular), or by a drug delivery system. The drug delivery system can comprise a drug implant with timed release, a masal spray or an injection of a long-lasting depo form. This method is used to alleviate symptoms such as nausea, vomiting, abdominal pain and caltered bowel habites. The sequences can be used to ctreat motility disorders in a wide variety of cher diseases including irritable bowel of syndroms, disperse, soleroderma and parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

"Isolation and identification of multiple neuropeptides of the
                                    allatostatin superfamily in the shore crab Carcinus maenas.";
Eur. J. Biochem. 250:727-734(1997).
-!- FUNCTION: MAY ACT AS A NEUROTRANSMITTER OR NEUROMODULATOR.
-!- SIMILARITY: BELONGS TO THE ALLATOSTATIN FAMILY.
Neuropeptide; Amidation; Multigene family.
MOD RES 8 8 AMIDATION (POTENTIAL).
SEQÜENCE 8 AA; 919 MW; C82879D5AB569AB5 CRC64;
